### 2.1 Using Terraform to set up ec2 instances for data science projects.

TERRAFORM

#### 2.1.1 Take Away

- you will learn how to automate ec2 setup using terraform that is suited for data science project.

#### 2.1.2 Tools

- EC2
- Terraform

#### 2.1.3 Requirements

##### 1. Knowledge Requirements

- understand basic of how to create terraform project
- understand basic of how to set up ec2 instances

##### 2. System Requirements

- WSL/Ubuntu
  - I have only tested this in WSL
- install all dependencies of cuda
  - for list of software requirements, see
    - \* [https://www.tensorflow.org/install/gpu#linux\\_setup](https://www.tensorflow.org/install/gpu#linux_setup)
- optional
  - Docker # References
- Terraform AWS documentation
  - [https://registry.terraform.io/providers/hashicorp/aws/latest/docs/resources/instance#availability\\_zone](https://registry.terraform.io/providers/hashicorp/aws/latest/docs/resources/instance#availability_zone)
- pytorch docker image
  - <https://github.com/anibali/docker-pytorch> # Content

#### 2.1.4 Code

##### 1. AWS

(a) export the following environment variables including

- `AWS_ACCESSKEYID`
- `AWS_SECRETACCESSKEY`
- `AWS_DEFAULTREGION`

##### 2. Terraform

(a) create terraform project

(b) In the project, create main.tf and copy&paste the following code

```
resource "aws_instance" "web" {
  ami = "ami-08962a4068733a2b6"
  instance_type = "p3.8xlarge"
  cpu_core_count = 16
  cpu_threads_per_core = 2
  tags = {
    Name = "HelloWorld"
  }
}
```

(a) now you have ec2 running with

#### 2.2 A Note of X where X = AWS EC2 services.

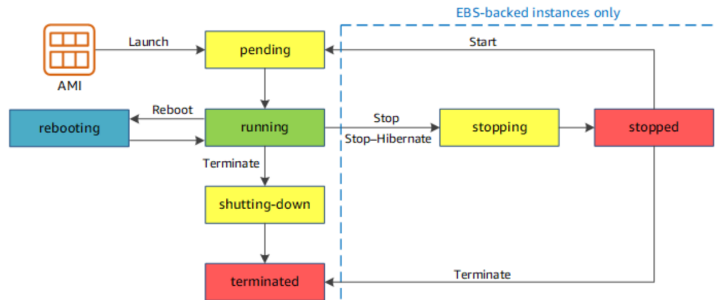

An EC2 instance has 4 state of life cycle: running, stopped, and terminated. Furthermore, state transition (or action) of an EC2 instance is launch, re-booting, pending, shutting-down, and stopping, see

Illustrate EC2 instance life cycle using state and state-transition () To launch EC2 from command line, write ~~

### 3 command line

#### 3.1 start instances

```
aws ec2 start-instances --instance-ids i-04857a8be9b9de952
```

The following table provides a brief description of each instance state and indicates whether it is billed or not.

Figure 1: EC2 instance life cycle

### 3.2 create security-group

```
aws ec2 create-security-group --group-name "expert-crypto" --description
"expert discovery for crypto"
```

### 3.3 create key-value pair

```
aws ec2 create-key-pair --key-name <your key name>
```

### 3.4 create new EC2 instance

```
aws ec2 run-instances --image-id ami-0fb653ca2d3203ac1 --instance-type
t2.micro --count 1 --security-group-ids sg-0db2887fa3dbd0493 --key-name
ExpertCrypto
```

### 3.5 create tags for resources

```
aws ec2 create-tags --resources i-07f6b9c46c87b4233 --tags Key=test,Value=test
```
