Contents

1	types of header parameters	1
2	Key binding	1

1 types of header parameters

According to Introduction to literate programming with org-mode and org-babel by howard

With the basics in place, the rest of this tutorial describes the source block controls done by parameter settings. I've separated and organized these based on its usage:

Evaluation Parameters like `dir`, affects how a block is executed
Export Parameters affects how a block or the results from execution is shown when it is exported to HTML
Literate Programming Parameters connecting blocks together to change the actual source code
Variable Parameters variables for a source block can be set in various ways
Miscellaneous Input/Output of course, you have to have a collection of parameters that don't fit elsewhere

2 Key binding

commands	key	doom key	custom key	description
org-footnote-action		spc-m-f		create footnotes
org-set-property	c-c c-x p	spc-m-o		set properties of file
